

# **COMPUTER VISION WORKSHOP**

# What exactly is computer vision?

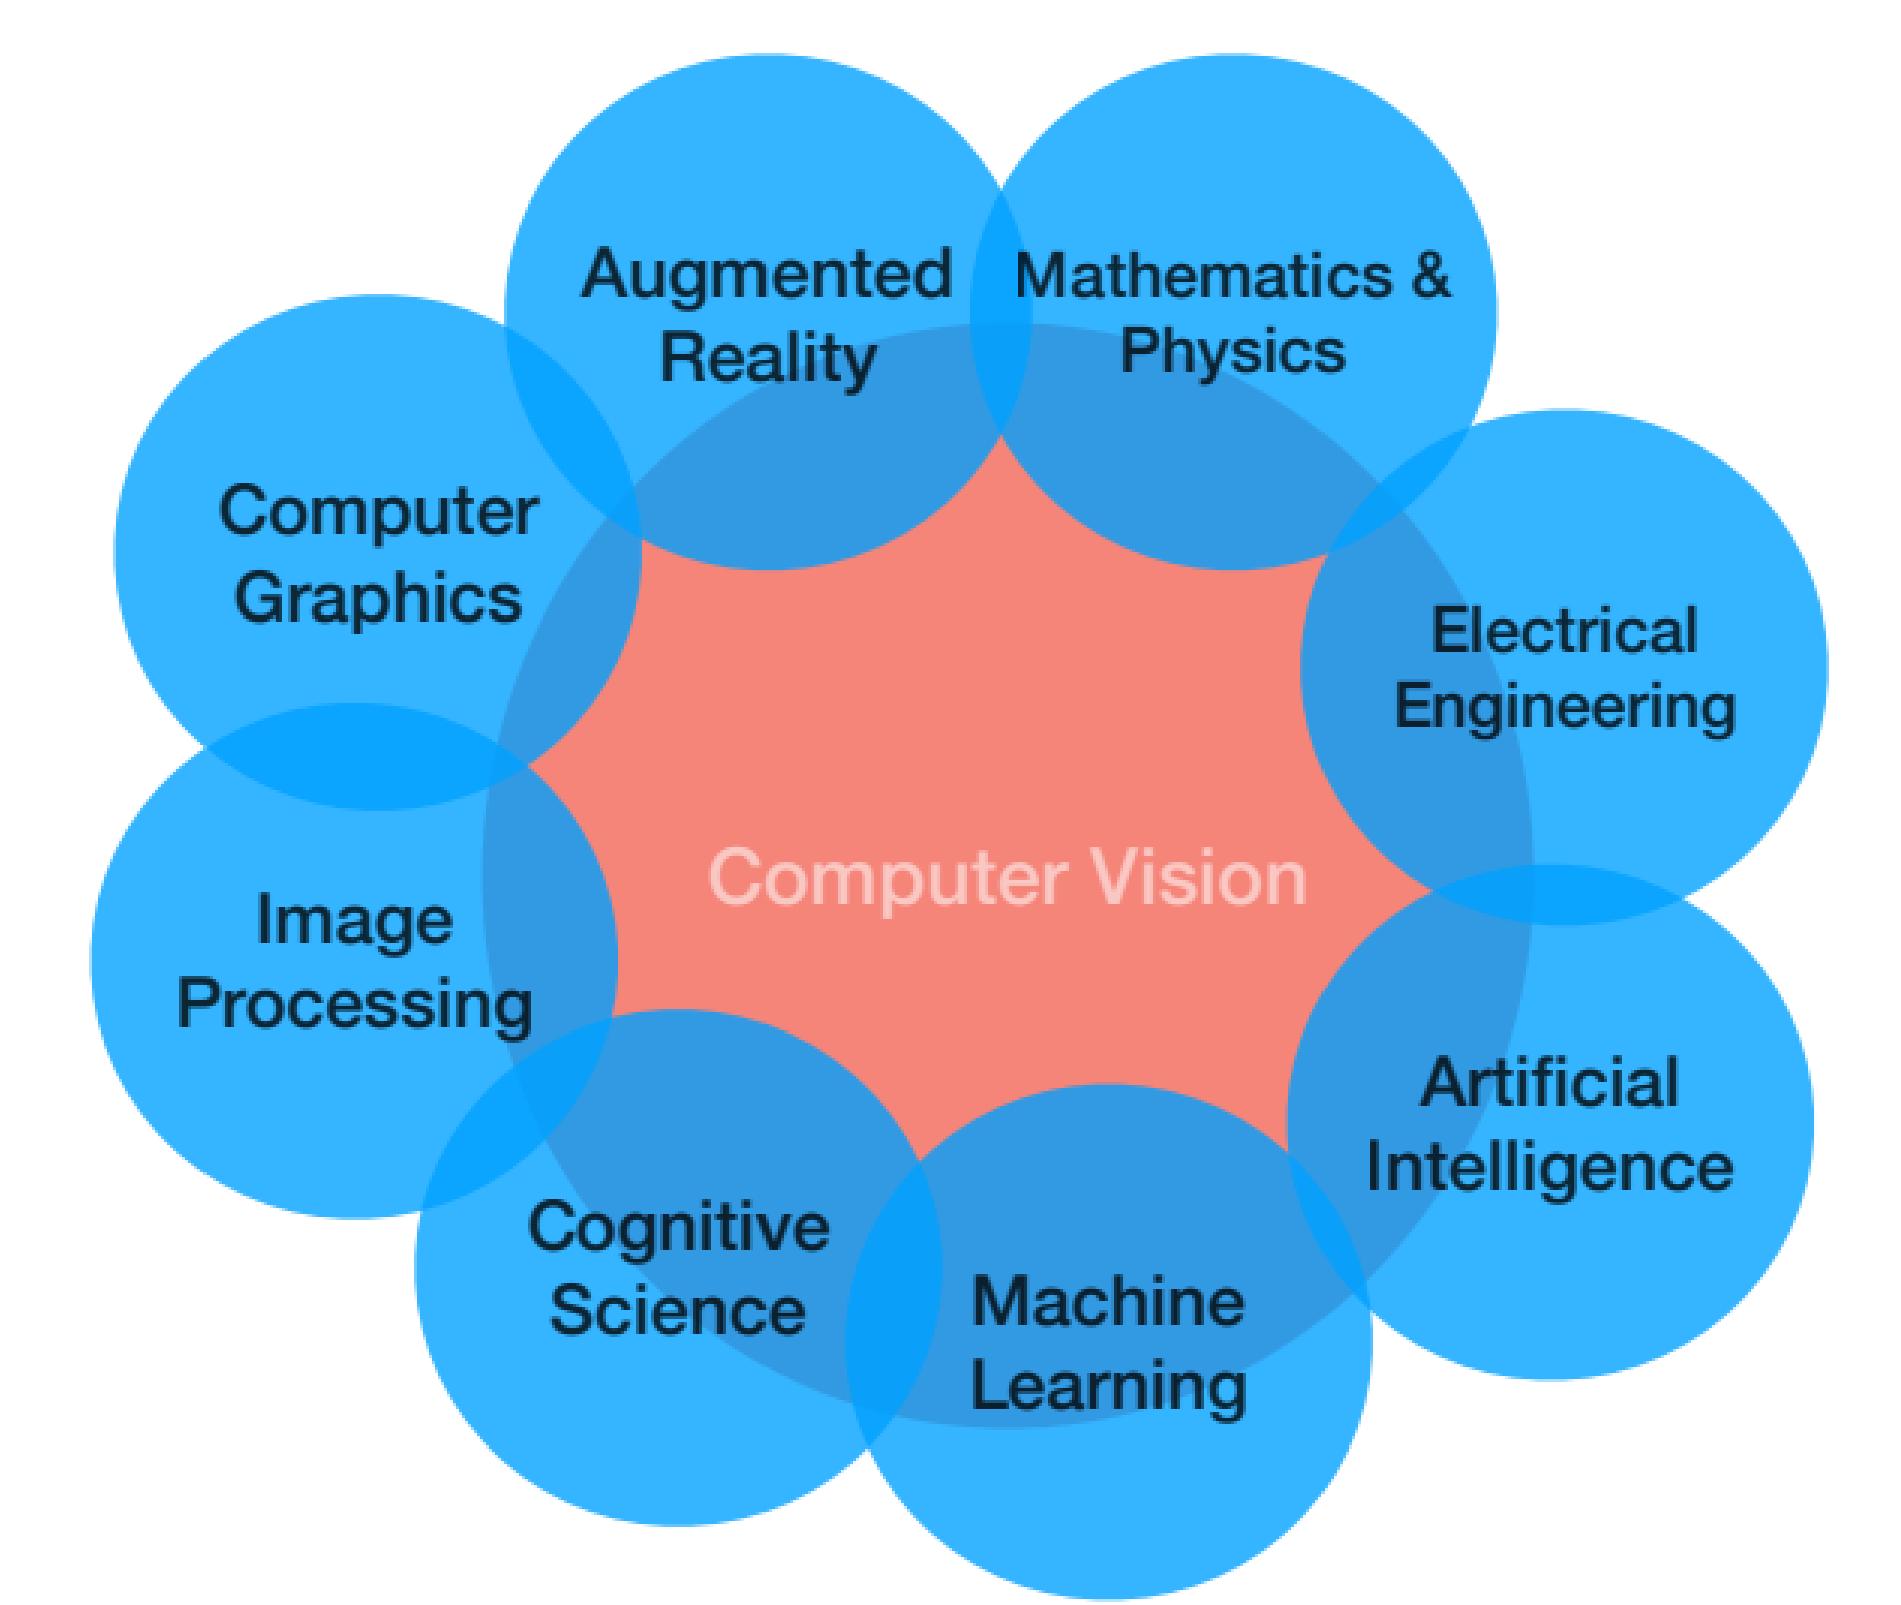

" An interdisciplinary field that aims to enable computers  
to gain **understanding of what is being seen** in images  
and videos "

# is computer vision artificial intelligence?

# Computer Vision is an amalgamation of many fields

# SOME CV APPLICATIONS

- Snapchat and Instagram filters
- Optical Character Recognition (OCR)
- Licence Plate Reading
- Self-driving cars
- Sporting Analysis
- Facial Recognition
- Object Detection
- Segmentation
- Image Similarity
- Deep Fakes

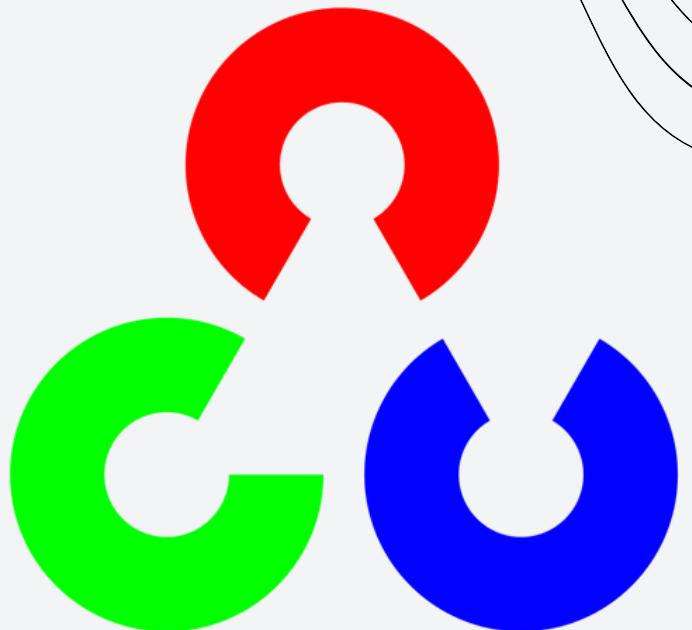

# What makes Python so great for Computer Vision?

- Easy to learn and accessible
- Language of Artificial Intelligence
- The best and easiest to use Libraries, such as:

OpenCV for Classical Computer Vision

PyTorch (Meta) and TensorFlow with Keras (Google)

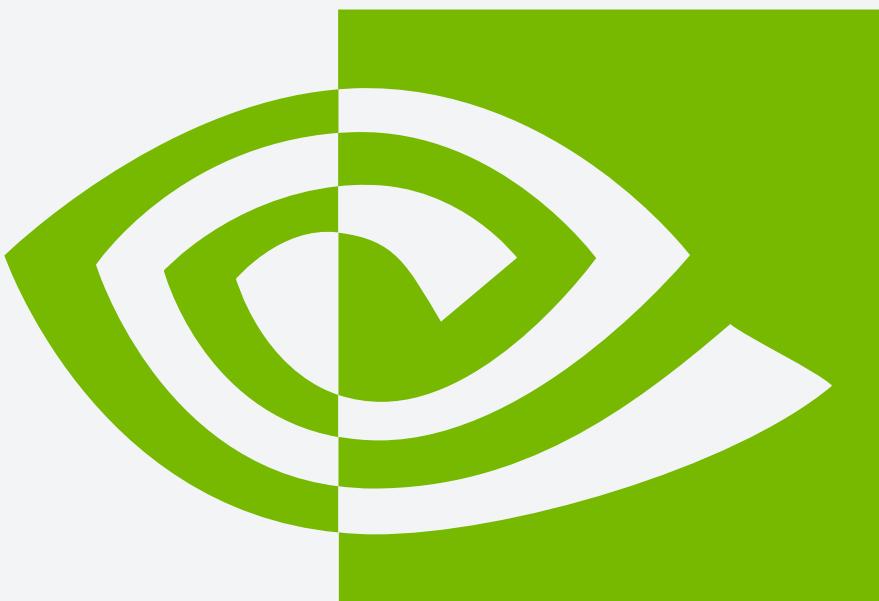

# Classical Computer Vision

- What is meant by **Classical Computer Vision?**
- It encompasses Computer Vision algorithms that **do not** involve Machine Learning
- Before the advent of ML and DL, CV was a deeply explored field and many useful algorithms were developed for things like **feature extraction, OCR, Segmentation and simple transformations.**

# Deep Computer Vision

- Deep Learning was used in Computer Vision since the 1990s, however due to the computational requirements and intricate design, it remained on the sidelines for decades.
- **Mature Deep Learning libraries** (TensorFlow, Keras, Theano)
- **Accessible GPU processing** (NVIDIA's CUDA)

# DEEP LEARNING CV VS CLASSICAL CV

## Deep Learning Computer Vision

- Adapts to new images well (assuming it's similar to the data it was trained on)
- Requires Models to be trained
- Requires GPU hardware (most times)

- Small changes can have big negative impacts
- Relies on hardcode features and parameters
- Can be run on CPU

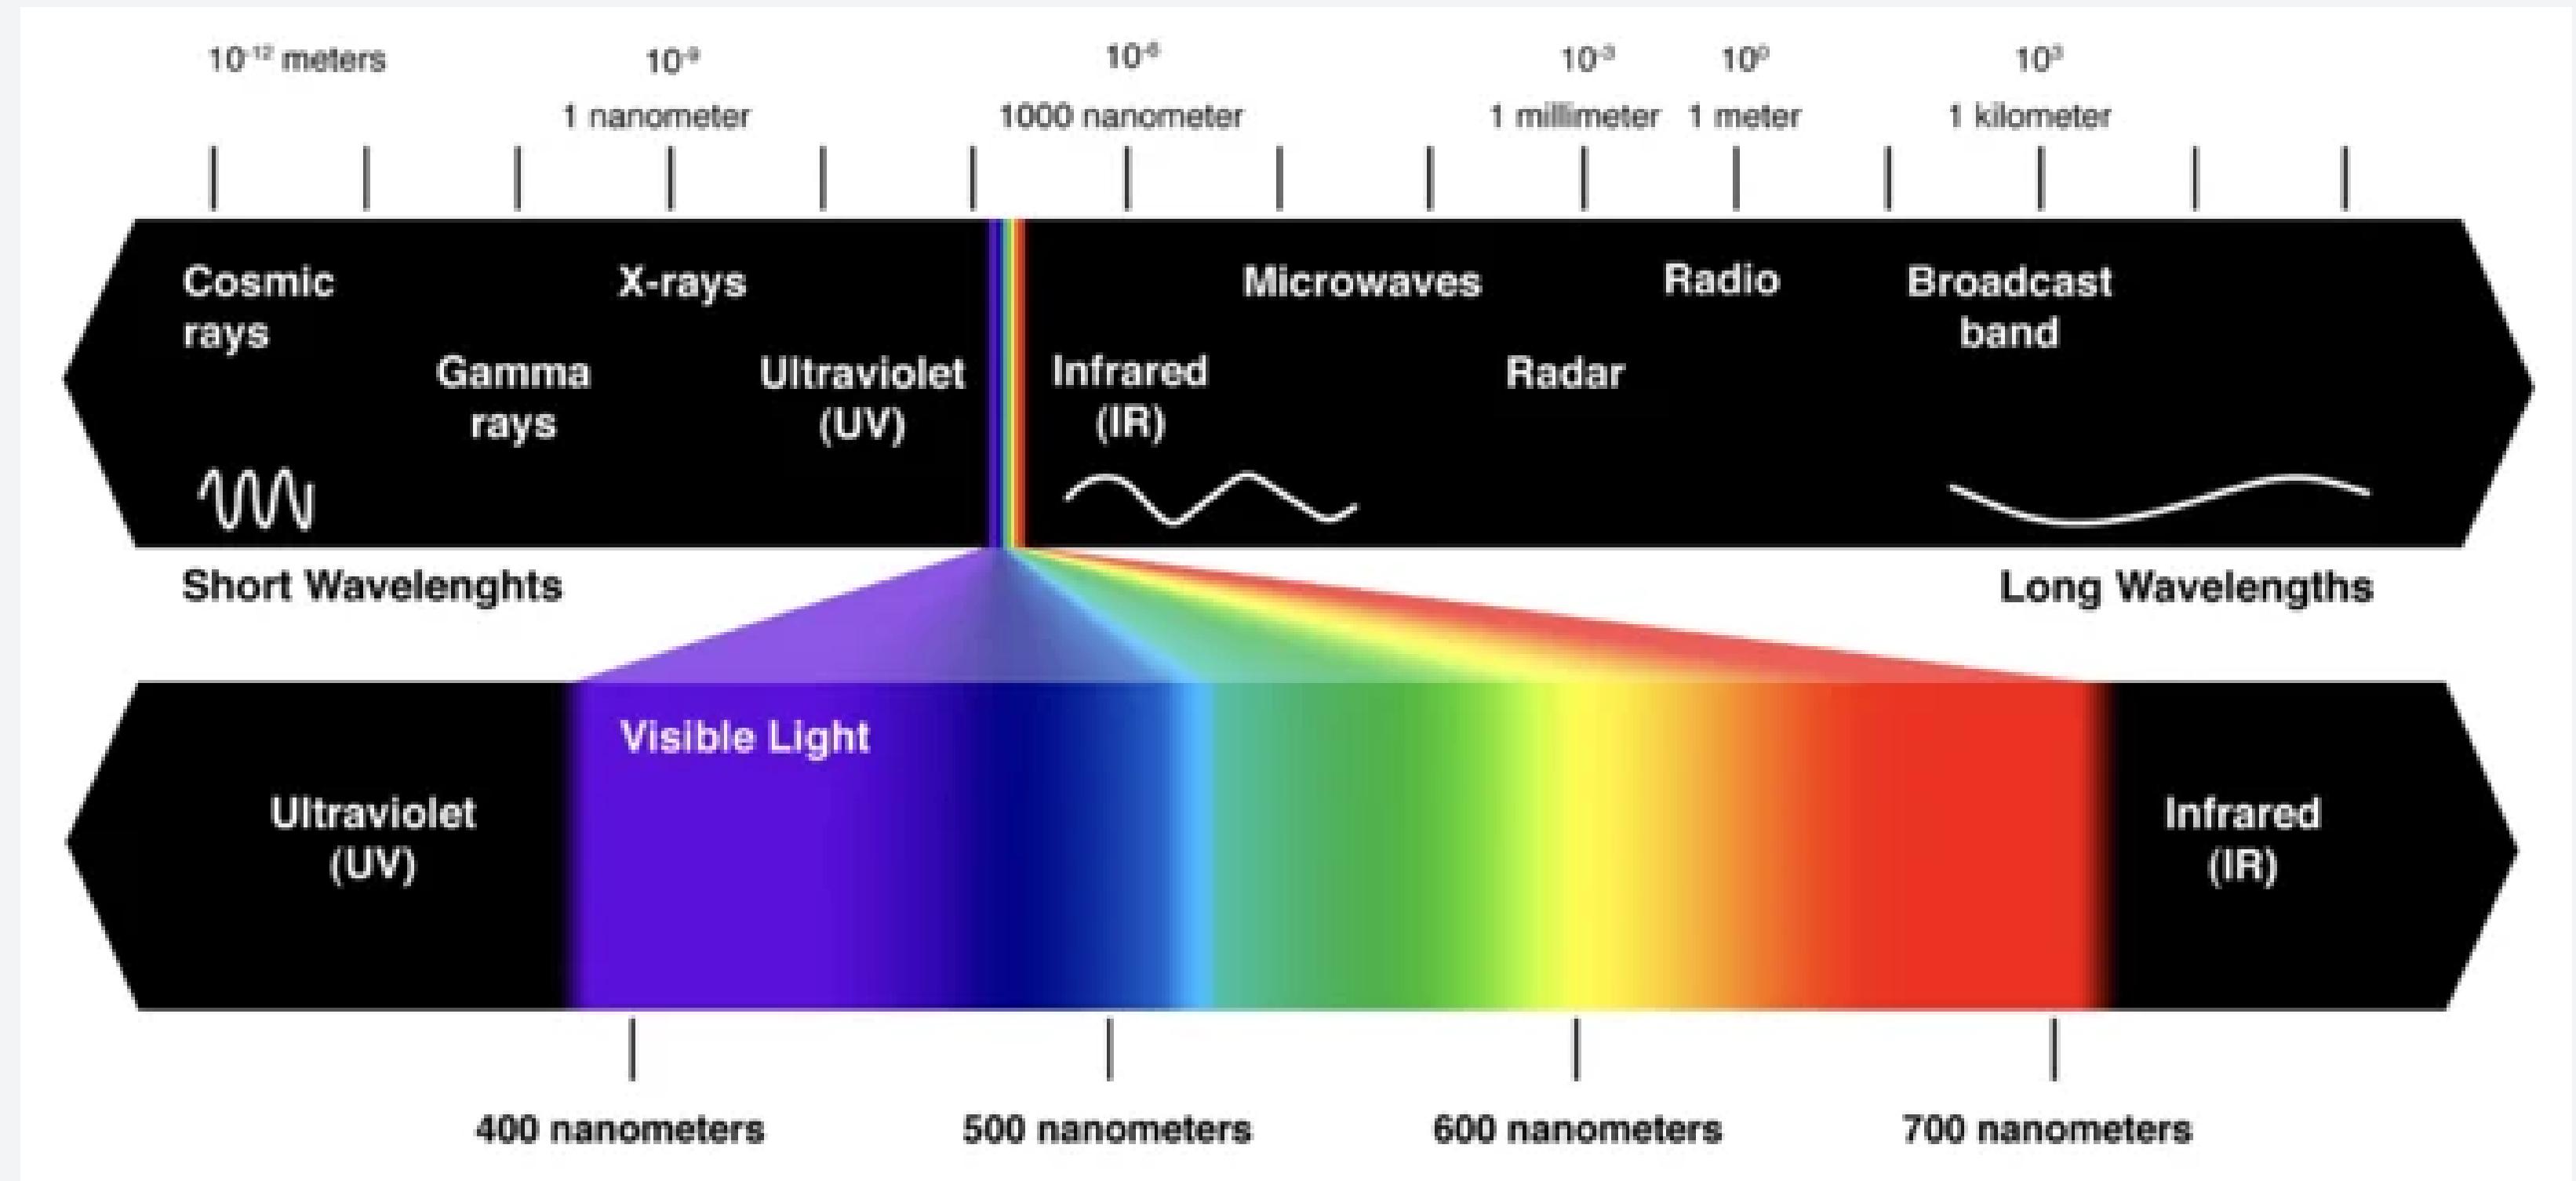

## Classical Computer Vision

# What are images?

- Images are 2-D representations of the **visible light spectrum**

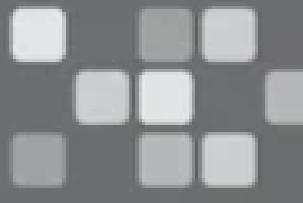

# Digital images format

- Images are stored in Multi-Dimensional Arrays

# Image file format

## Raster images

Pixel-based graphics  
Resolution dependent  
Photos & web graphics

JPG

Web & print  
photos and  
quick previews

GIF

Animation &  
transparency in  
limited colors

PNG

Transparency  
with millions  
of colors

TIFF

High quality  
print graphics  
and scans

RAW

Unprocessed  
data from  
digital cameras

PSD

Layered Adobe  
Photoshop  
design files

## Vector images

Curve-based graphics  
Resolution independent  
Logos, icons, & type

PDF

Print files and  
web-based  
documents

EPS

Individual  
vector design  
elements

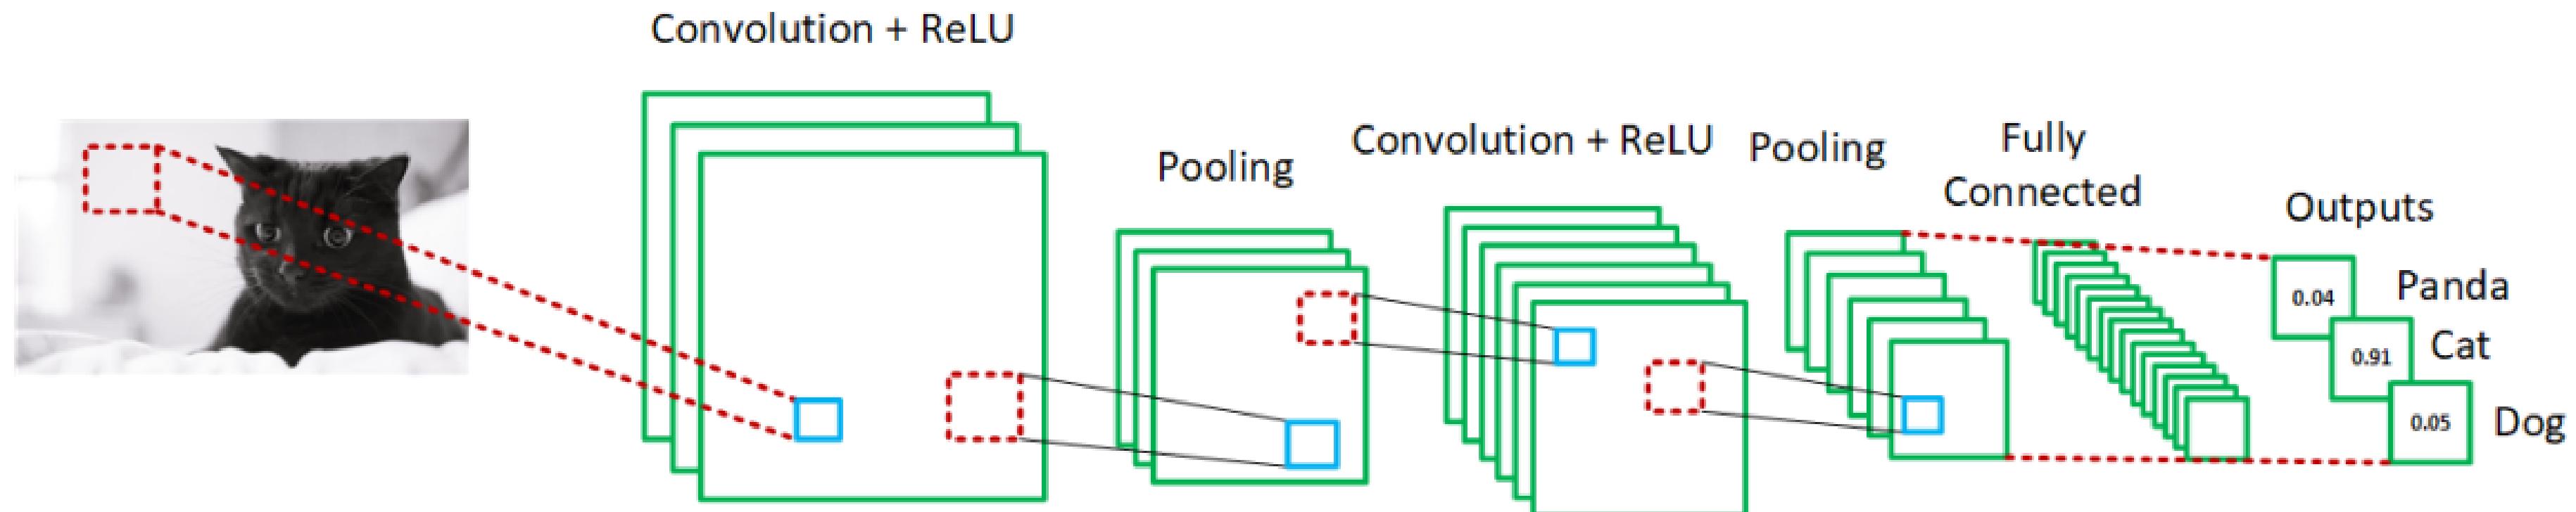

AI

Original Adobe  
Illustrator  
design files

SVG

Vector files  
for web  
publishing

# CONVOLUTIONAL NEURAL NETWORKS

# The Convolution Operation

- Mathematical term to describe the process of combining two functions to produce a **third**
- In our situation, the output is called a Feature Map
- We use a matrix, called a Filter or **Kernel** that is applied to our Image
- So the first ‘Function’ is the image that is combined with the Kernel or Filter which produces a feature map

**Feature Map Image  $\times$  Kernel = Feature Map**

# The Convolution Operation

1	0	1	0	1
1	0	0	1	1
0	1	1	0	0
1	0	0	1	0
0	0	1	1	0

\*

0	1	0
1	0	-1
0	1	0

=

2	1	-1
-1	1	3
2	1	1

Input Image

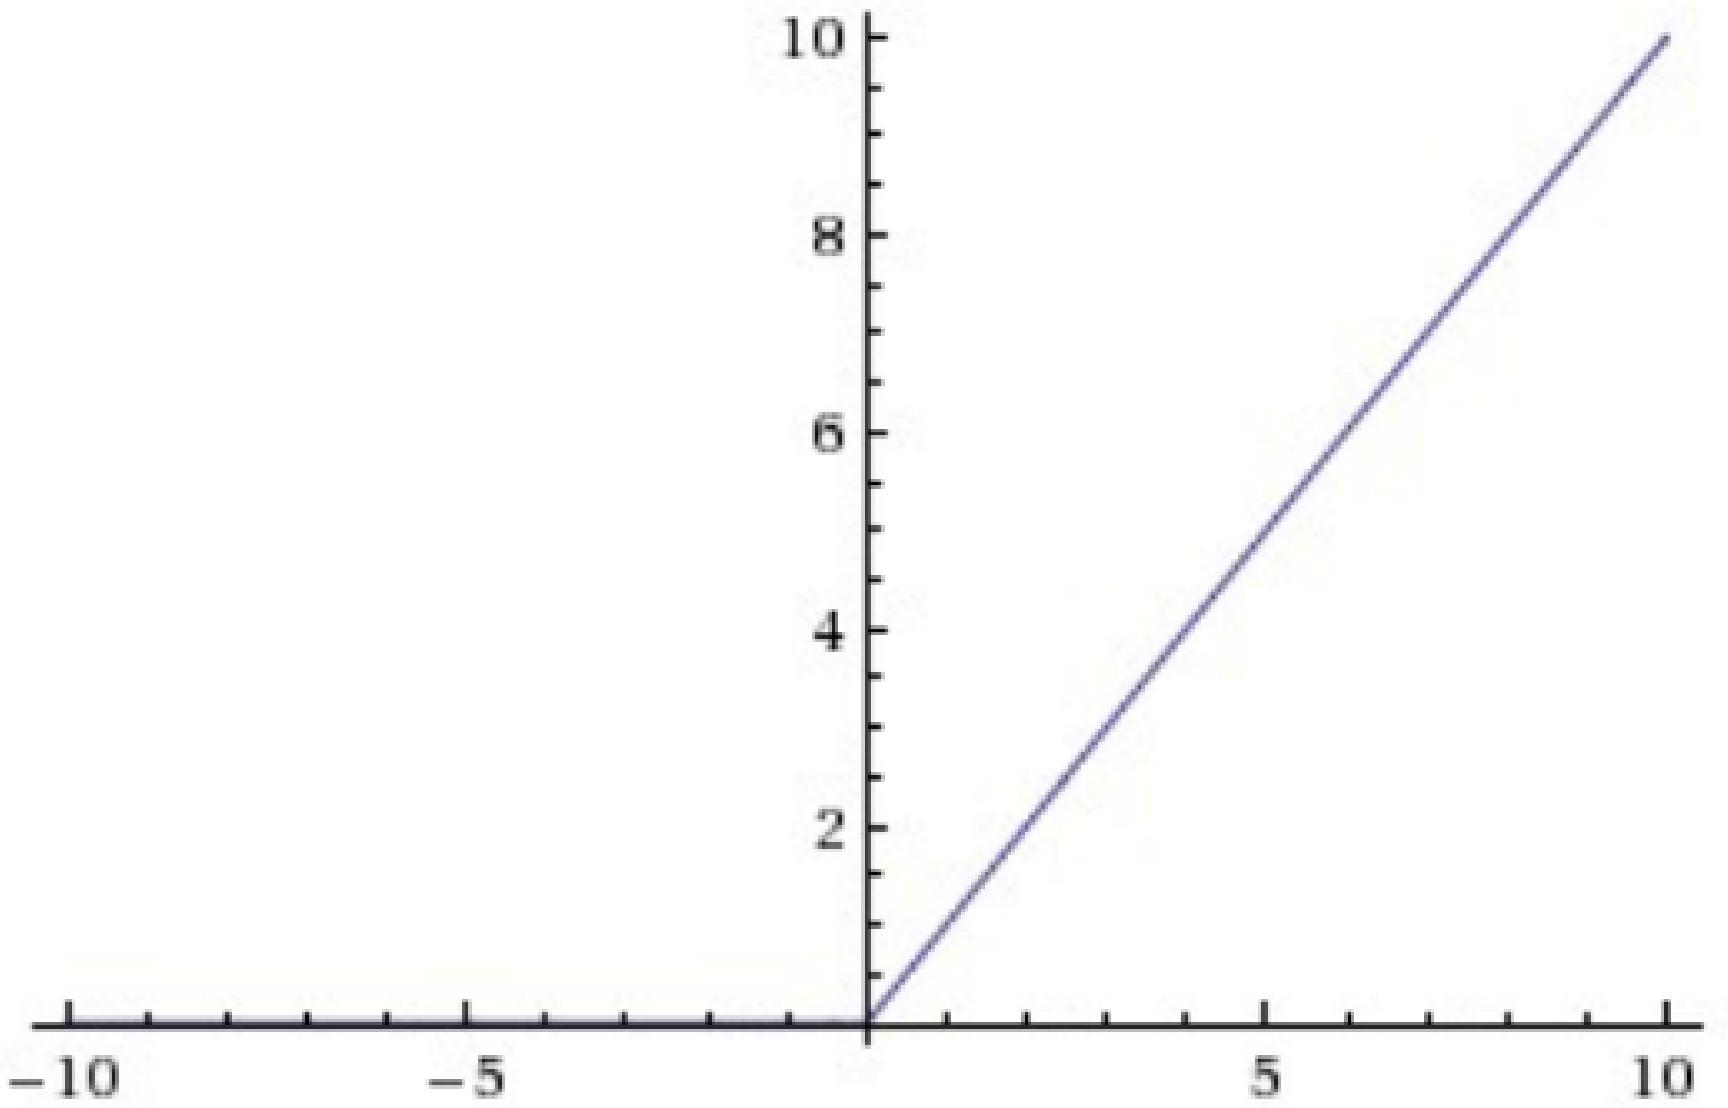

Filter or Kernel

Output or Feature Map

# The ReLU Operation

- Change all negative values to 0
- Leave all positive Values alone

$$f(x) = \max(0, x)$$

# Applying the ReLU Activation

1	0	1	0	1
1	0	0	1	1
0	1	1	0	0
1	0	0	1	0
0	0	1	1	0

\*

0	1	0
1	0	-1
0	1	0

Filter or Kernel

=

2	1	-1
-1	1	3
2	1	-5

ReLU

2	1	0
0	1	3
2	1	0

Rectified Feature Map

One Layer

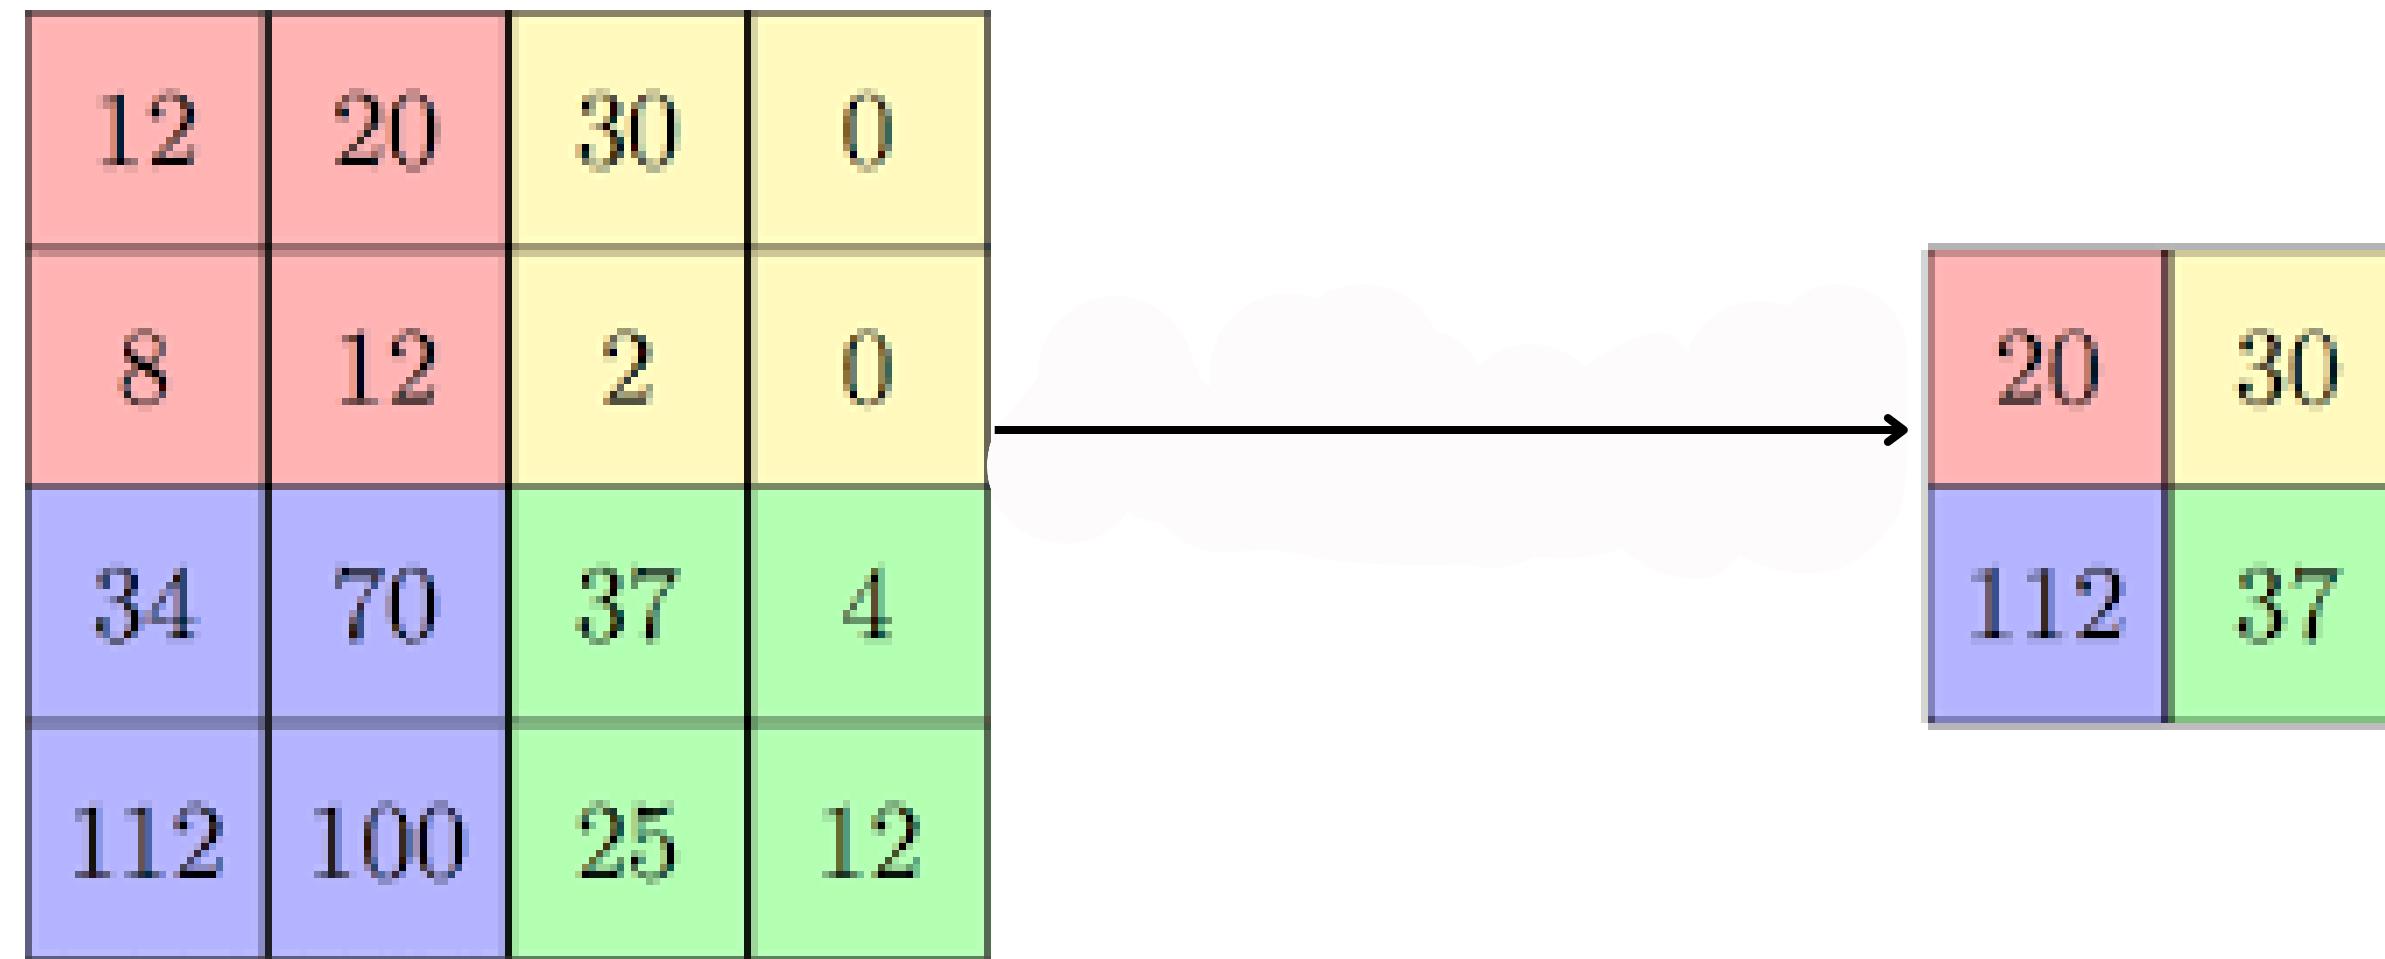

Input Image

# Pooling

- Pooling is the process whereby we reduce the size or dimensionality of the Feature Map
- This allows us to reduce the number of Parameters in our Network whilst retaining important features
